

User Management Dashboard

Objective

Develop a simple web application where users can view, add, edit, and delete user details from a mock backend API.

Requirements

User Interface:

- Display a list of users with details such as ID, First Name, Last Name, Email, and Department.
- Provide buttons or links to "Add", "Edit", and "Delete" users.
- A form to input a new user's details or edit an existing user's details.
- Add pagination options to the page with 10, 25, 50, and 100 limits. Alternatively, you can implement infinite scrolling.
- Add a filter popup allowing users to filter by first name, last name, email, and department.
- Implement search and sort
- Make the interface responsive.

Backend Interaction:

- Use [JSONPlaceholder](#), a free online REST API that you can use for demonstration and test purposes.
- Specifically, use the '/users' endpoint to fetch and manipulate user data.

Functionality:

- View: Display all users by fetching data from the '/users' endpoint.
- Add: Allow adding a new user by posting to the '/users' endpoint. (Note: JSONPlaceholder won't actually add the user, but will simulate a successful response.)
- Edit: Allow editing of an existing user. This should involve fetching the current data for a user, allowing for edits, and then putting the updated data back via the API.
- Delete: Allow users to be deleted, by sending a delete request to the API.

Error Handling & Validations:

- Handle scenarios where the API request might fail - show an error message to the user in such cases.
- Add client-side validation for the user input form.

Guidelines

- Your primary focus should be on functionality. However, a clean UI will be appreciated.
- You may use vanilla JavaScript or any JavaScript framework/library of your choice like React, Angular, Vue, etc.
- Consider using tools like Axios or Fetch API for HTTP requests.
- Ensure the solution is modular and scalable.
- Document any assumptions you make.

Submission

- Share the above implementation using a public git repo
- Include a README detailing setup and run instructions.
- Reflect on the challenges faced during the development process and any improvements you would make if given more time.
- Share the Deployment Link of your project

Timeline

- Your submission needs to be within **2 days** of receiving this document.
- The faster turn-around will be awarded bonus points.

Please check the [Code Evaluation Criteria](#) carefully before proceeding.
